IT Service and Maintenance Management System
Office Requester or Office Representative
IT Coordinator
IT Technician
System
Start
Office needs IT assistance
Submit service request
Agree on new maintenance date
Start
Create maintenance schedule
Enter telephone, email, walk-in, or on-site request
Record maintenance schedule: office, assets, category, checklist, frequency, due date, technician
Check maintenance schedule
Next scheduled check
Keep schedule active and wait
No
Maintenance due?
Yes
Check job for schedule occurrence
Job already exists?
No
Generate linked maintenance job
Yes
Use existing job; do not duplicate
Maintenance Job Record
Office available?
Return to scheduled maintenance check
Calculate next due date
Record reschedule
On agreed date
Assign technician and coordinate visit
No
Perform maintenance checklist using Section 2
Yes
Record task, result, findings, technician, date, and evidence
Additional fault discovered?
No
Continue maintenance verification
Yes
Create linked corrective ticket following Section 1
Continue maintenance documentation
Follow Section 1
Record service request
Status: Submitted
Status and audit history
Return to Section 1
Use Section 3 confirmation and closure
Supply missing information
Request missing details
Review request
Details complete?
Yes
Assess impact and urgency
Set priority and target completion date
Assign technician
No
Return to review; no new ticket
Update existing ticket
Status: Needs Information
Status: Assigned
Notify technician and requester
To Section 2
Review ticket and previous office or asset history
Coordinate service schedule
Status: In Progress
Active request withdrawn
Resolved
Return to Section 2 diagnosis
Follow up dependency
Dependency outcome?
Still pending
Continue follow-up
Record follow-up updates
Cannot proceed
Record cancellation reason
Diagnose issue and record findings
Parts, approval, or external support needed?
No
Perform repair, installation, configuration, troubleshooting, or other IT service
Record diagnosis, actions, parts, costs, labor, dates, and evidence
Return to diagnosis
Test result
Service passed testing?
No
Record failed test
Yes
Status: On Hold
Record dependency, reason, responsible person, and next action
Yes
Resolved means technician testing passed
Status: Resolved
Notify office ready for confirmation
Status: Cancelled
Notify requester
Preserve records and activity history
Captured ticket, office, requester, category, issue, date, asset, attachments, source
To Section 3
Review and verify service result
Office accepts result?
Accepted
Record confirmation, confirming person, and date
Rejected
Record office feedback
No response
When office responds
Maintenance confirmation
Create new ticket linked to previous service record
Yes
Keep status: Resolved
Send follow-up reminder
Status: Closed
Maintenance closure
Record maintenance outcome
Do not mark incomplete or cancelled maintenance successful
Update office and asset service history
Office IT Service Register
Legend: rounded = Start/End; rectangle = Activity; diamond = Decision; cylinder = Data Store; dashed = Loop or alternate
Generate Office IT Service Reports
Filter by office, date range, category, technician, and status
Service history, completed totals, pending and overdue, workload, turnaround, costs, recurring issues, compliance
Cancelled separate from completed totals; authorized office access; role-based IT access; preserve completed records and audit history; office-linked services
Update office service history and reporting
Issue recurs after closure?
No
End
Service record retained

IT Service and Maintenance Management System
Owner: Anthony Derecho
Last Updated: January 30, 2021
Scope: Covers office IT service requests, technician assignment and execution, office confirmation and closure, cancellation, scheduled preventive maintenance, central office-linked records, audit history, and reporting. The scope begins when an office needs IT assistance or maintenance is scheduled and ends when the service record is retained or the maintenance schedule returns to its next check.

Office IT Service Request, Maintenance, and Closure Workflow

Diagram information

This diagram outlines the end-to-end management of office IT services, including request submission, ticket review, technician assignment, diagnosis, repair, testing, office confirmation, maintenance scheduling, dependency handling, closure, reporting, and record retention. It links office requesters, IT coordinators, IT technicians, and system records while preserving status and audit history.

Office IT Service and Maintenance Management SOP

1. Start when an office needs IT assistance.
    1.1. Accept requests by telephone, email, walk-in, or on-site channels.
    1.2. Capture the office, requester, category, issue, date, asset, attachments, and request source.
2. Create a service ticket linked to any previous service record and set the status to Submitted.
3. Review the request for completeness.
    3.1. If information is missing, set the status to Needs Information.
    3.2. Request the missing details from the office.
    3.3. Update the existing ticket when information is received; do not create a duplicate ticket.
4. Assess the request's impact and urgency.
5. Set the priority and target completion date.
6. Assign a technician and notify the technician and requester.
7. If the request is withdrawn, record the cancellation reason, set the status to Cancelled, notify the requester, and preserve the record.
8. If the request is placed on hold because of a dependency, record the dependency, reason, responsible person, and next action.
    8.1. Follow up on the dependency and record each update.
    8.2. If the dependency remains pending, continue follow-up.
    8.3. If the dependency is resolved, return the request to active processing.
    8.4. If the dependency cannot proceed, record the cancellation reason and cancel the request.
9. Review the ticket and previous office or asset history.
10. Coordinate the service schedule with the office.
11. Diagnose the issue and record findings.
12. Determine whether parts, approval, or external support are required.
    12.1. If required, place the request on hold and document the dependency.
    12.2. If not required, perform the repair, installation, configuration, troubleshooting, or other IT service.
13. Record the diagnosis, actions, parts, costs, labor, dates, and supporting evidence.
14. Test the completed service.
    14.1. If testing fails, record the failed test and return to diagnosis.
    14.2. If testing passes, set the status to Resolved and notify the office that confirmation is required.
15. Request office confirmation of the result.
    15.1. If the office accepts the result, record the confirmation, confirming person, and date.
    15.2. If the office rejects the result, record the feedback and return to diagnosis.
    15.3. If there is no response, retain the Resolved status and send a follow-up reminder.
16. Close the service record after confirmation or authorized closure, and preserve all activity history.
17. Update the office service history and reporting data.
18. If the issue recurs after closure, create a new ticket linked to the previous service record and follow the service-request procedure.
    18.1. If the issue does not recur, retain the service record and end the workflow.
19. For maintenance planning, create a schedule containing the office, assets, category, checklist, frequency, due date, and assigned technician.
20. Check the maintenance schedule at each scheduled interval.
    20.1. If maintenance is not due, keep the schedule active and wait for the next check.
    20.2. If maintenance is due, check whether a job already exists for that occurrence.
    20.3. Use the existing job when one exists; otherwise generate a linked maintenance job record.
21. Assign the maintenance technician and coordinate the visit.
22. Confirm office availability.
    22.1. If the office is unavailable, agree on a new maintenance date and record the reschedule.
    22.2. On the agreed date, continue with the maintenance visit.
23. Perform the maintenance checklist using the approved maintenance procedure.
24. Record each task, result, finding, technician, date, and evidence.
25. Determine whether an additional fault was discovered.
    25.1. If an additional fault is found, create a linked corrective ticket and follow the service-request procedure.
    25.2. If no additional fault is found, continue maintenance verification.
26. Record the maintenance outcome.
    26.1. Do not mark incomplete or cancelled maintenance as successful.
    26.2. Update the office and asset service history.
    26.3. Calculate the next due date and return to the scheduled maintenance check.
27. Use the Section 3 confirmation and closure process for completed maintenance.
28. Maintain system controls and records.
    28.1. Keep Cancelled records separate from completed totals.
    28.2. Restrict office access to authorized users and apply role-based IT access.
    28.3. Preserve completed records and audit history.
29. Generate Office IT Service Reports.
    29.1. Filter reports by office, date range, category, technician, and status.
    29.2. Report completed totals, pending and overdue work, workload, turnaround time, costs, recurring issues, compliance, and service history.
